AI Automation Assessment: Website Knowledge Chatbot

Candidate: Ahmad Ali | vornexia4@gmail.com | 13 October 2026

1. What was built

A grounded RAG chatbot that answers visitor questions about the ITC Immunity Therapy Center using ONLY content from 7 official PlacidWay pages. Stack: n8n (AI Agent + Tools), Pinecone (vector store), OpenAI (gpt-4o-mini chat + embeddings). Public demo with a simple chat UI, no login required.

2. Architecture

Chat flow: Chat Trigger (public webhook) -> AI Agent (Tools Agent, gpt-4o-mini) with Simple Memory (follow-up context) and one tool: Pinecone vector store 'Placidway Chatbot' (index 'placidway', namespace 'Rag', topK 5, OpenAI embeddings). A strict system prompt forces the agent to call the tool for factual questions and forbids inventing prices, clinics, treatments, or medical facts. Response mode 'lastNode' returns the answer directly from the webhook.

Indexing flow: n8n Form Trigger (PDF upload) -> Default Data Loader -> OpenAI embeddings -> Pinecone insert. Re-upload the source PDF to refresh the knowledge base.

3. Knowledge sources (only these 7 pages)

1. https://www.placidway.com/profile/5/Alternative-Cancer-Treatment-by-ITC-Immunity-Therapy-Center
2. https://www.placidway.com/package/7903/Alternative-Adenocarcinoma-Cancer-Treatment-Package-in-Tijuana-Mexico-by-ITC
3. https://www.placidway.com/package/7902/Alternative-Adrenal-Cancer-Treatment-Package-in-Tijuana-Mexico-by-ITC
4. https://www.placidway.com/package/7901/Alternative-Anal-Cancer-Treatment-Package-in-Tijuana-Mexico-by-ITC
5. https://www.placidway.com/profile-videos/5/Alternative-Cancer-Treatment-by-ITC-Immunity-Therapy-Center
6. https://www.placidway.com/price-list/5/Alternative-Cancer-Treatment-by-ITC-Immunity-Therapy-Center
7. https://www.placidway.com/search-medical-pricings/Alternative-Medicine/All/1

4. Grounding and safety rules (AI Agent system prompt)

- Answer factual questions ONLY from Pinecone retrieval; never from training data.
- Unknown -> exact fallback: "I'm sorry, but I couldn't find verified information about this in the available PlacidWay knowledge base. Please contact PlacidWay directly for accurate information."
- Prices always with currency and context (e.g. "$18,995 USD, out-patient, 3 weeks").
- False visitor premises (e.g. "$50 treatment") are never confirmed.
- Booking requests -> PlacidWay contact/quote form; the bot cannot book.

- Out-of-scope questions (weather, etc.) politely declined.
- Medical advice -> no diagnosis; recommend a healthcare professional.
- Follow-ups resolved via Simple Memory; greetings answered without retrieval.

5. How to replicate

1. Pinecone (free): create index 'placidway'; OpenAI API key (gpt-4o-mini + embeddings).
2. n8n: import workflows/placidway-chatbot.json; connect Pinecone + OpenAI credentials.
3. Run the 'On form submission' flow once, uploading Placidway-ITC-7-Pages.pdf (the 7 pages).
4. Activate the workflow; copy the Chat Trigger production webhook URL.
5. Paste the URL into docs/index.html (WEBHOOK_URL); host via GitHub Pages.

6. Test results (8 required questions, live bot, 2026-10-13)

[PASS] Treatment cost by country - $18,995 / $30,000 USD with program context.

[PARTIAL] Price comparison (Mexico vs USA) - Mexico prices grounded; USA range looks like model knowledge.

[PASS] Package inclusions - Detailed, grounded in the package page.

[PASS] Follow-up: recovery time - Resolved against previous treatment via memory.

[PASS] Appointment request - Gave PlacidWay steps; did not claim to book.

[PASS] Out-of-scope: weather - Politely declined.

[PASS] Medical advice: diabetes - No diagnosis; referred to a professional.

[PARTIAL] False price: "$50" - Did not confirm; missed explicit correction with $18,995.

7. Links

Public demo (no login): https://ahmadali810.github.io/placidway-itc-chatbot/
GitHub repo (workflow JSON, docs, tests): https://github.com/Ahmadali810/placidway-itc-chatbot
The demo and n8n instance stay live well beyond the required 7 days.

8. Known limitations

- Country comparisons can leak general model knowledge; prompt needs a harder constraint.
- False premises get a soft deflection instead of an explicit price correction.
- Prices are only as fresh as the last indexing run.
- Free-tier quotas (Pinecone, OpenAI) suit assessment traffic, not production scale.
